**NewVendor**

This routine generates initial versions of all files, needed in the rule writing process. If the file that QUECK wants to generate already exists, a back-up of the original file is saved in /home/karen/.QUECK/Rules.bu or /home/karen/.QUECK/RuleFunctions.bu

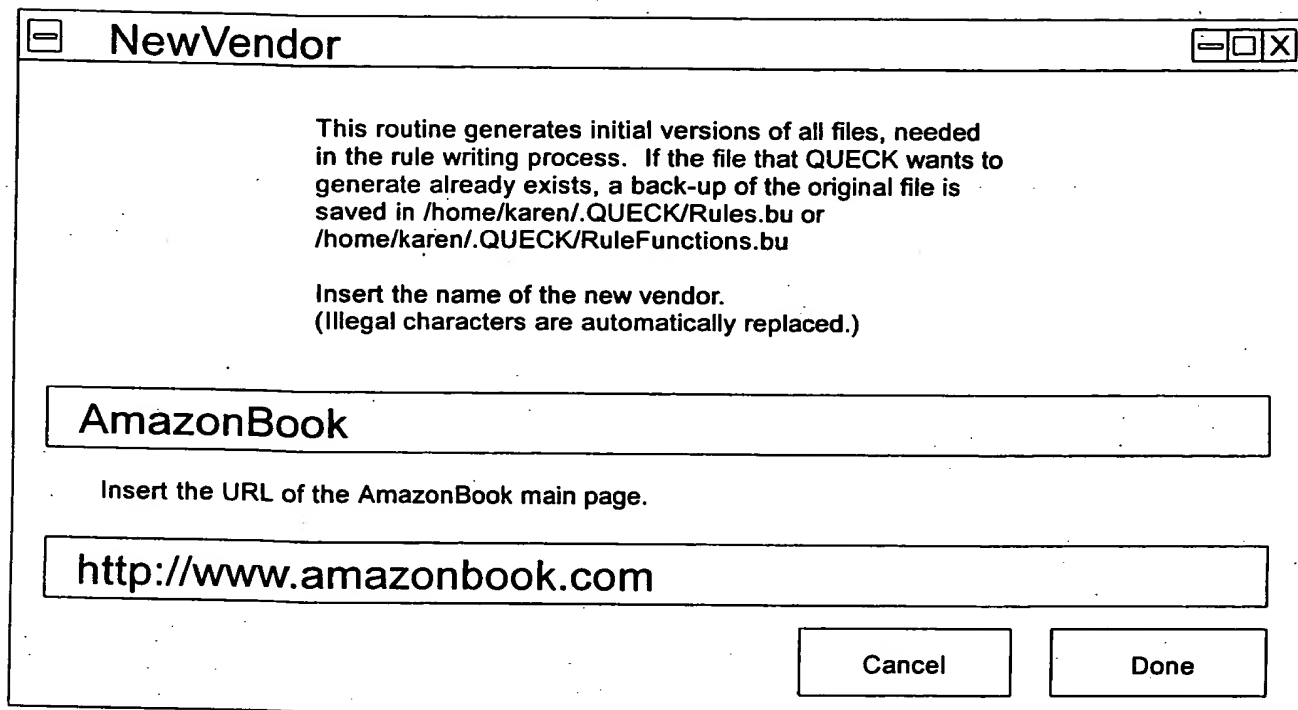

Insert the name of the new vendor.  
(Illegal characters are automatically replaced.)

A dialog box titled "NewVendor" with a standard window control bar (minimize, maximize, close). The text inside reads: "This routine generates initial versions of all files, needed in the rule writing process. If the file that QUECK wants to generate already exists, a back-up of the original file is saved in /home/karen/.QUECK/Rules.bu or /home/karen/.QUECK/RuleFunctions.bu". Below this, it says: "Insert the name of the new vendor. (Illegal characters are automatically replaced.)". There is a text input field containing "AmazonBook". Below that, it says: "Insert the URL of the AmazonBook main page.". There is another text input field containing "http://www.amazonbook.com". At the bottom right are two buttons: "Cancel" and "Done".

This routine generates initial versions of all files, needed in the rule writing process. If the file that QUECK wants to generate already exists, a back-up of the original file is saved in /home/karen/.QUECK/Rules.bu or /home/karen/.QUECK/RuleFunctions.bu

Insert the name of the new vendor.

A dialog box titled "Search Data Editor" with a standard window control bar (minimize, maximize, close). It contains two text input fields: the first is labeled "ISBN:" and the second is labeled "UPC:". Below these fields is a grid of ten diamond-shaped icons arranged in two rows of five. The first icon in the top row is filled, while the others are empty. At the bottom right are four buttons: "Clear", "Reset", "Save", and "Done".

A dialog box titled "TestUrl" with a standard window control bar (minimize, maximize, close). The text inside reads: "QUECK has computed the URL of the page corresponding to your query ISBN=1565921496. The computation is based on the first form of the search page. The result is loaded into Netscape. If the resulting page is incorrect, press 'Next' to analyze the next form on the search page. If the resulting page is correct, press 'OK'." At the bottom right, there are three buttons: "Cancel", "Next", and "OK".

TestUrl

QUECK has computed the URL of the page corresponding to your query ISBN=1565921496.

The computation is based on the first form of the search page.

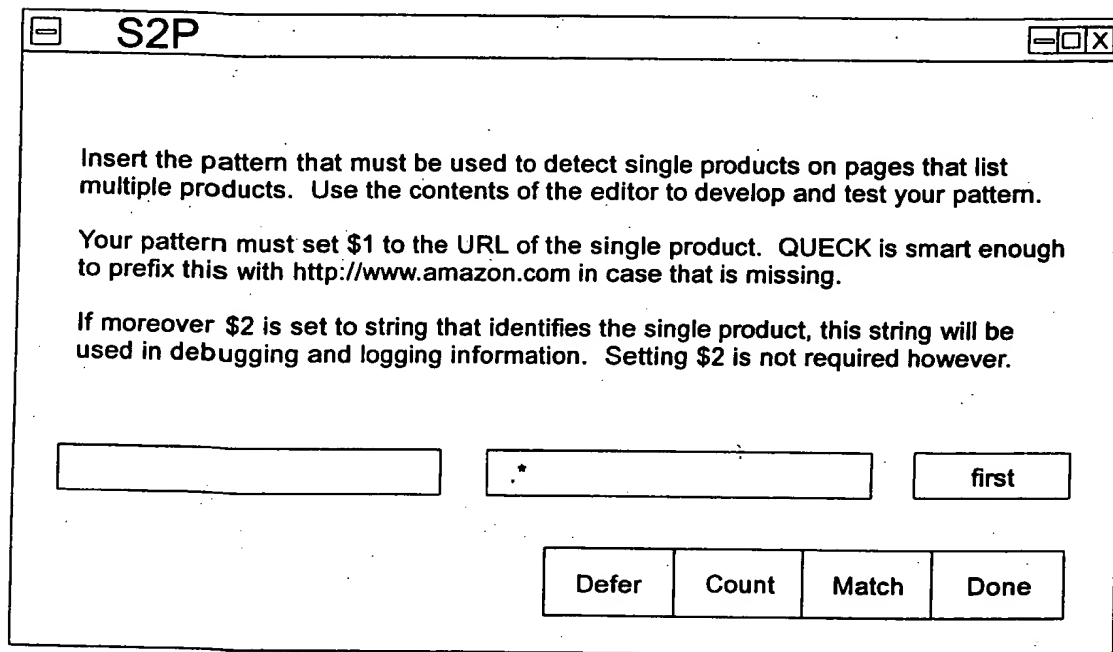

The result is loaded into Netscape. If the resulting page is incorrect, press "Next" to analyze the next form on the search page.

If the resulting page is correct, press "OK".

A dialog box titled "S2P" with a standard window control bar (minimize, maximize, close). The text inside reads: "Insert the pattern that must be used to detect single products on pages that list multiple products. Use the contents of the editor to develop and test your pattern. Your pattern must set \$1 to the URL of the single product. QUECK is smart enough to prefix this with http://www.amazon.com in case that is missing. If moreover \$2 is set to string that identifies the single product, this string will be used in debugging and logging information. Setting \$2 is not required however." Below the text are two input fields: the first is empty, and the second contains an asterisk (\*). To the right of the second input field is a button labeled "first". At the bottom right, there are four buttons: "Defer", "Count", "Match", and "Done".

S2P

Insert the pattern that must be used to detect single products on pages that list multiple products. Use the contents of the editor to develop and test your pattern.

Your pattern must set \$1 to the URL of the single product. QUECK is smart enough to prefix this with http://www.amazon.com in case that is missing.

If moreover \$2 is set to string that identifies the single product, this string will be used in debugging and logging information. Setting \$2 is not required however.

FIG. 20

2100

NSP

Insert the pattern that must be used to detect links on multiple products pages to even more multiple product pages. Use the "Match" button to test your pattern.

Your pattern must set \$1 to the URL of the new multiple product page. QUECK is smart enough to prefix this with <http://www.amazon.com> in case that is missing.

If your query does not generate enough product hits to have more than one multiple product page, you can choose "Defer" and defer the configuration until you run a query that actually does generate enough product hits to have more than one multiple product page.

FIG. 22

**2300**

SpiderSubr

Insert here the URL of the page, currently loaded into Netscape. This is the page associated to the full\_spider rule.

Next, set "SpiderDepth" to the maximum number of links that has to be followed from the top of the hierarchy to the actual product pages. Note that in some cases this number depends on the branch you follow. Setting "SpiderDepth" too low creates a spider that misses products that are nested too deep in the hierarchy. Setting "SpiderDepth" too high leads to a decrease in performance.

SpiderSubr

http://www.amazon.com/exec/obidos/subst/home/home.html/002-5797861-2625002

The spider you specified is a level - 1 spider.  
This means that your spider has the following form:

level - 0: The top page (accessed via the URL above)

level - 1: The single product pages to be spidered

Insert below the pattern used to detect level - 1 pages on the top page.

Your pattern must set \$1 to the URLs of the child pages. QUECK is smart enough to prefix this URL with http://www.amazon.com in case it is missing. If your pattern also sets \$2, that value will be used in the hierarchy attributes.
